

Department of Physics and Astronomy
University of Heidelberg

Bachelor Thesis in Physics
submitted by

Sophia Milanov

born in Düsseldorf (Germany)

2016

Title

This Bachelor Thesis has been carried out by Sophia Milanov at the
Max Planck Institute for Astronomy in Heidelberg
under the supervision of
Dr. Glenn van de Ven

Abstract

Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like “Huardest gefburn”? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

Contents

1 Introduction

1.1 motivation

1.2 What is a globular cluster in the Milky Way?

150 of them

kugelförmige anordnung von Sternen 10^6 bis 10^8

große frage: IMBHs ja/nein

stellar population with plot of cmd (characteristics of each stage) without isochrones

explaining the different evolution stages and binaries included and refer to 3.1.

1.3 Actions&orbits

integral of motion

klarste beschreibung des orbits

actions zeitlich konstant

schon lange sind actions bekannt

auch vom sonnensystem

für andere extrem schwierig zu berechnen

mit supercomputern endlich möglich

2 Method & Theory

2.1 observed kinematics in GCs

2.2 Orbits

Poisson's equation density & potent

2.3 actions

3 Analysis

3.1 Description of the simulation

where simulation comes from and what it is & description of output

x-y-z plot how it looks like

test of sphericity & center

cmd with isochrones explaining them and showing that they fit with the simulation

3.2 Investigation in phase space

Paolo class

3.2.1 Velocity dispersion

aussage

plots

erklärung physikalisch

3.2.2 anisotropy

3.2.3 Density profile

plots

bestätigung kugelförmig

potential daraus

3.2.4 Potential

3.3 Investigations of orbits in action space

wilma class

3.3.1 Orbits

3.3.2 Actions

3.3.3 Integral of motions along orbits

4 Results & Discussion

only triangle plots

4.1 Actions from different globular clusters

4.2 Discussion & future perspectives

do the same distinguishing the mass of the stars
redo the work with only observational light data

5 Conclusion
